

Respiratory report

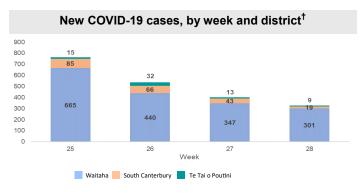

Week 28, ending Thursday 11 July 2024

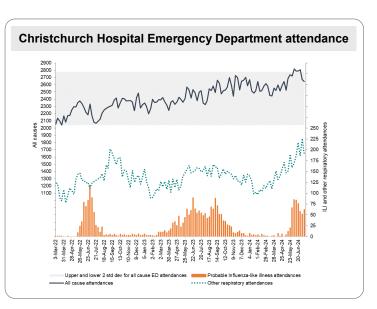

Health New Zealand
Te Whatu Ora

Key points

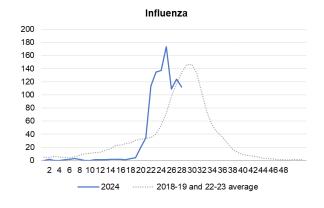

- Total influenza identifications decreased slightly in the last reporting week in Waitaha Canterbury.
- Influenza A continues to predominate.
- RSV identifications are higher than average for this time of year in Waitaha Canterbury.
- Reported COVID-19 case numbers decreased in the last two reporting weeks in Waitaha Canterbury, South Canterbury and Te Tai o Poutini West Coast.

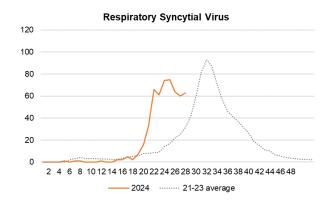

Waitaha Canterbury District positive laboratory influenza and RSV identifications, by week

ESR respiratory illness dashboard

The following data can be viewed on the ESR respiratory illness dashboard, which is updated weekly (www.esr.cri.nz/digital-library/respiratory-illness-dashboard/):

- Community influenza-like illness (ILI) activity—national and local trends:
 - HealthStat General Practice ILI consultation rates.
 - HealthLine ILI-related call rates.
 - FluTracking participant fever and cough symptoms.
- Viruses detected through sentinel and non-sentinel testing.

Prepared on 15 July 2024 by the Te Waipounamu Intelligence group, Ōtautahi Christchurch office, National Public Health Service https://intel.cph.co.nz/reports-in-detail/influenza-and-respiratory-pathogens/

^{*}Influenza and RSV identifications for Waitaha Canterbury District are provided by Canterbury Health Laboratories (CHL), and may include data from Ashburton Hospital and Te Tai o Poutini District. Note 2020 and 2021 data were not included in historical averages due to no influenza identifications in the community during the reporting period.

[†] Includes imported and locally acquired self-reported cases.
